

THE ACCURACY OF THIS TIDAL GRAPH IS APPROXIMATE ONLY AND CANNOT BE RELIED UPON FOR NAVIGATION

1. Extract from tide tables the times and heights for HW & LW for the required date.
2. Using tidal data draw a LW to HW time line and tide height line on the graph.
3. Choose any intermediate point (time) between HW & LW on the time line. From the point draw a line up to the central curve and then across to intersect the tide height line. This is the inter-tidal height above datum at the chosen time.
